ACTUAL GOOGLE GEMINI API · NO SIMULATED PROVIDER

PrivacyTwin
Live AI review at 70%

The request, actual proposals, local decisions and lifecycle actions—with screenshots.

29 October 2026, 22:58 IST · gemini-3.1-flash-lite
Run d2181d5e-34f3-4c1f-9b78-a5dc55319742

Three synthetic fields. One live request for this review. A separate database.

What changed for this review

The requested automatic-application threshold is now **70% inclusive**. Clear proposals at exactly 70% may apply if they pass the existing local evidence, ambiguity and revision checks. Mixed fields and missing metadata still require unresolved outcomes.

> This is a model-confidence cutoff, not a claim of 70% detection accuracy. The application now offers 70% as a supported selection. The general default remains 95%; this run explicitly selected 70%.

Previous review versus this review

Run	Threshold	Automatically applied	Pending after AI	Provider tokens
Original real run	95%	0	6	2180
This real run	70%	2	4	2123

These are two separate live calls with potentially different model outputs. The table documents observed behavior; it does not measure accuracy or isolate a causal effect on accuracy.

The original 95% run is preserved in references/review-95-percent.json. Nothing in that earlier record was relabelled as a 70% run.

A first 70% attempt (9bc769ec-a6ad-4492-90c4-21c02a002087) failed with: Gemini could not be reached or returned an unreadable response. Resume this run later. It produced no applied proposals. That record is preserved in references/failed-70-percent-attempt.json. A separate fresh test produced the completed run documented here. The application did not automatically retry or switch models.

How the real run worked

Synthetic CSV → ordinary scanner → aggregate profiles and detector evidence → actual Gemini API → structured proposals → local validation → confidence ≥ 70% + clear outcome → saved AI-attributed review.

Input: 20 synthetic records and 3 fields. email has consistent email evidence; employee_id has internal-ID evidence; contact_value contains 10 email-shaped and 10 mobile-shaped values. All three fields lack five metadata requirements, producing 15 documentation gaps.

Field-name sharing was off. The saved aggregate input is in downloads/provider-aggregate-input.json. It contains counts, profiles, candidate scores, evidence references and metadata presence states; raw source rows and the server credential are absent. Detector identifiers can still reveal semantic types, so aggregate input is not a claim of anonymity.

The original provider result is retained before user actions. Accepting unresolved metadata records that assessment without filling documentation. Reject creates no review; revoke supersedes an applied decision. An ordinary replacement scan then reopens the AI-origin employee_id classification, with no second AI call for the change.

Screenshot contents

1. Choose the synthetic input
2. The deterministic scanner runs first
3. Configure this review at 70%
4. The server sends the aggregate evidence
5. Inspect the actual completed run
6. Read the email classification proposal
7. Missing documentation stays unresolved
8. Mixed evidence needs clarification
9. Applied AI decisions appear in the inventory
10. Accepting unresolved records the gap, not completeness
11. Reject a proposal without saving a review
12. The report includes AI provenance and unresolved work
13. Revoke an applied AI decision
14. ReviewGuard also checks AI-origin decisions

Actual proposals and final action states

Field	Scope	Outcome / class	Confidence	After AI	After review actions
contact_value	classification	unresolved	45%	pending	pending
contact_value	metadata	unresolved	100%	pending	pending
email	classification	Contact	70%	applied	revoked / superseded
email	metadata	unresolved	100%	pending	applied / current
employee_id	classification	Identity	70%	applied	applied / reopened
employee_id	metadata	unresolved	100%	pending	rejected

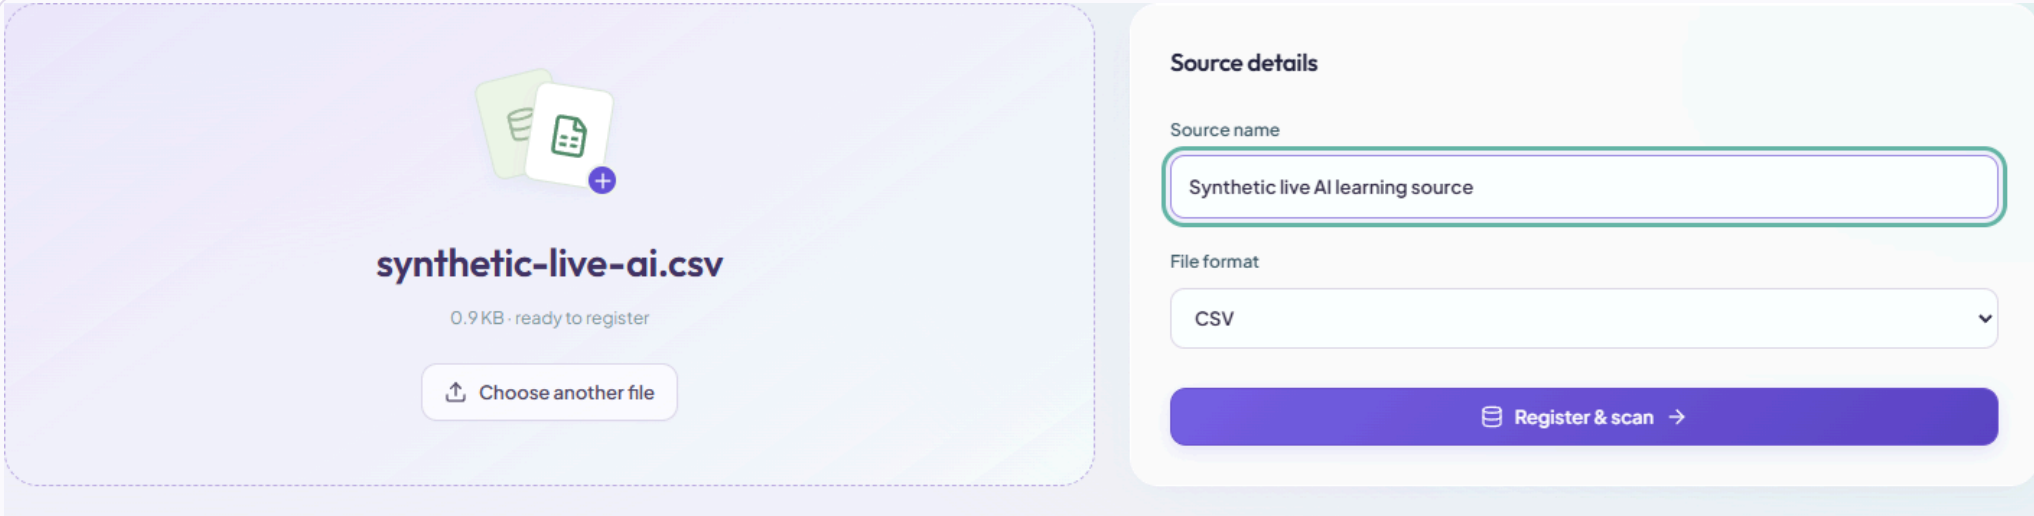

The first status is captured immediately after the real provider run. The last status follows acceptance, rejection, revocation and the replacement scan. Current describes freshness; unresolved describes an outcome. All 15 documentation gaps remain until an owner supplies declarations.

> A 100% confidence unresolved metadata proposal means the model is certain that documentation is missing. It is not a clear approval and cannot become automatically complete at any confidence threshold.

ACTUAL GEMINI RUN · SCREENSHOT 01

Choose the synthetic input

Twenty synthetic records contain three fields: email, employee_id and a mixed contact_value. No owner purpose or retention is declared. The source file stays local; the provider receives aggregate evidence instead of these rows.

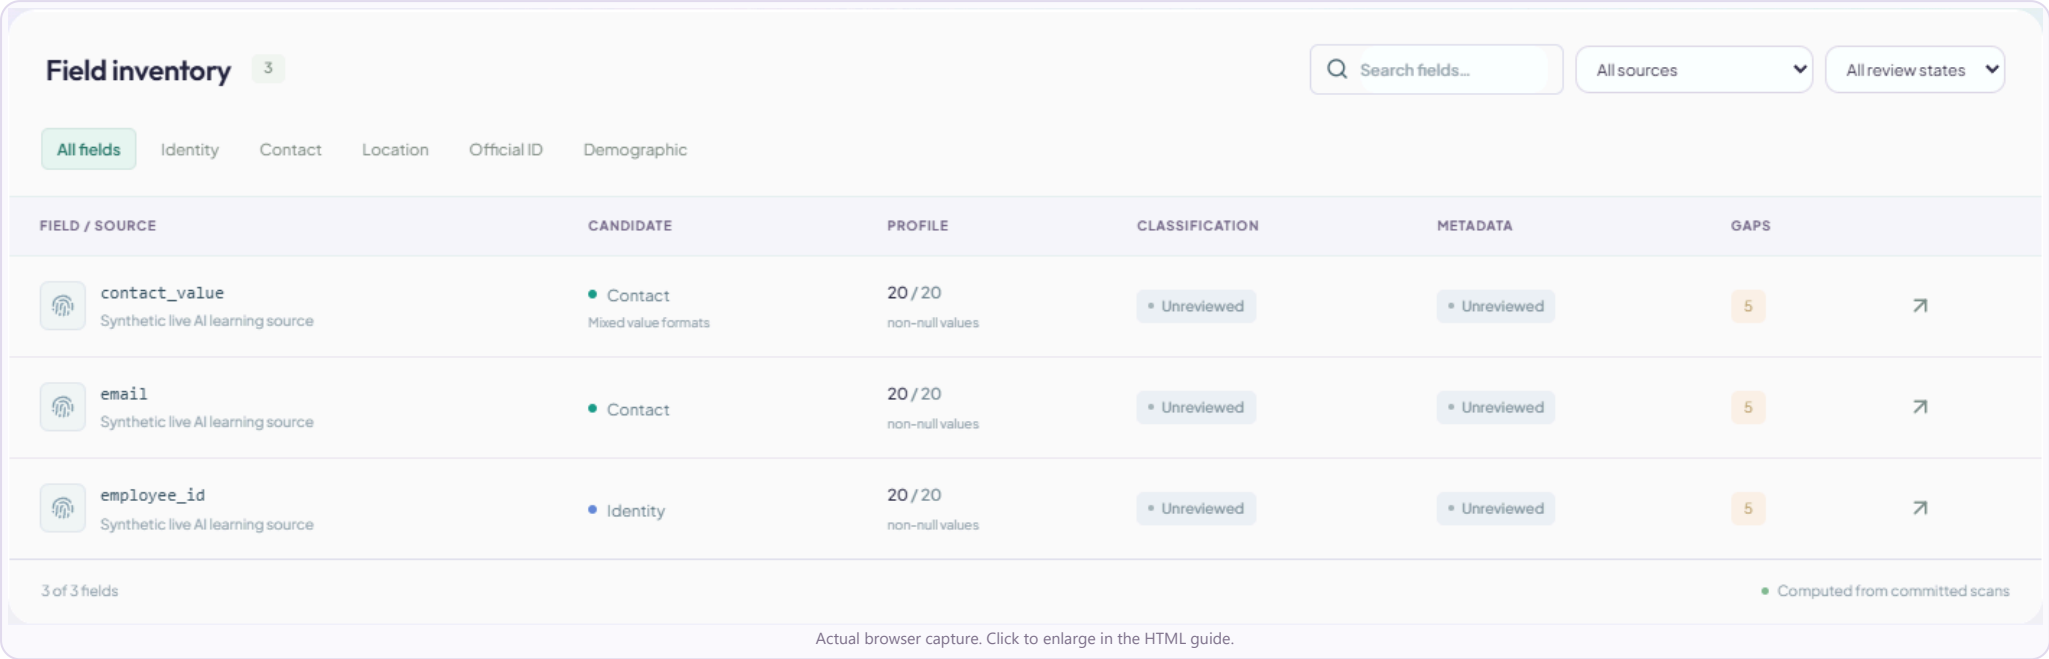

Actual browser capture. Click to enlarge in the HTML guide.

Observed: Input selected; the source has not yet been registered.

ACTUAL GEMINI RUN · SCREENSHOT 02

The deterministic scanner runs first

The ordinary scanner calculates candidate classes and evidence before any AI call. The mixed contact_value contains both email and mobile-shaped values. All three fields still need reviews and declared metadata.

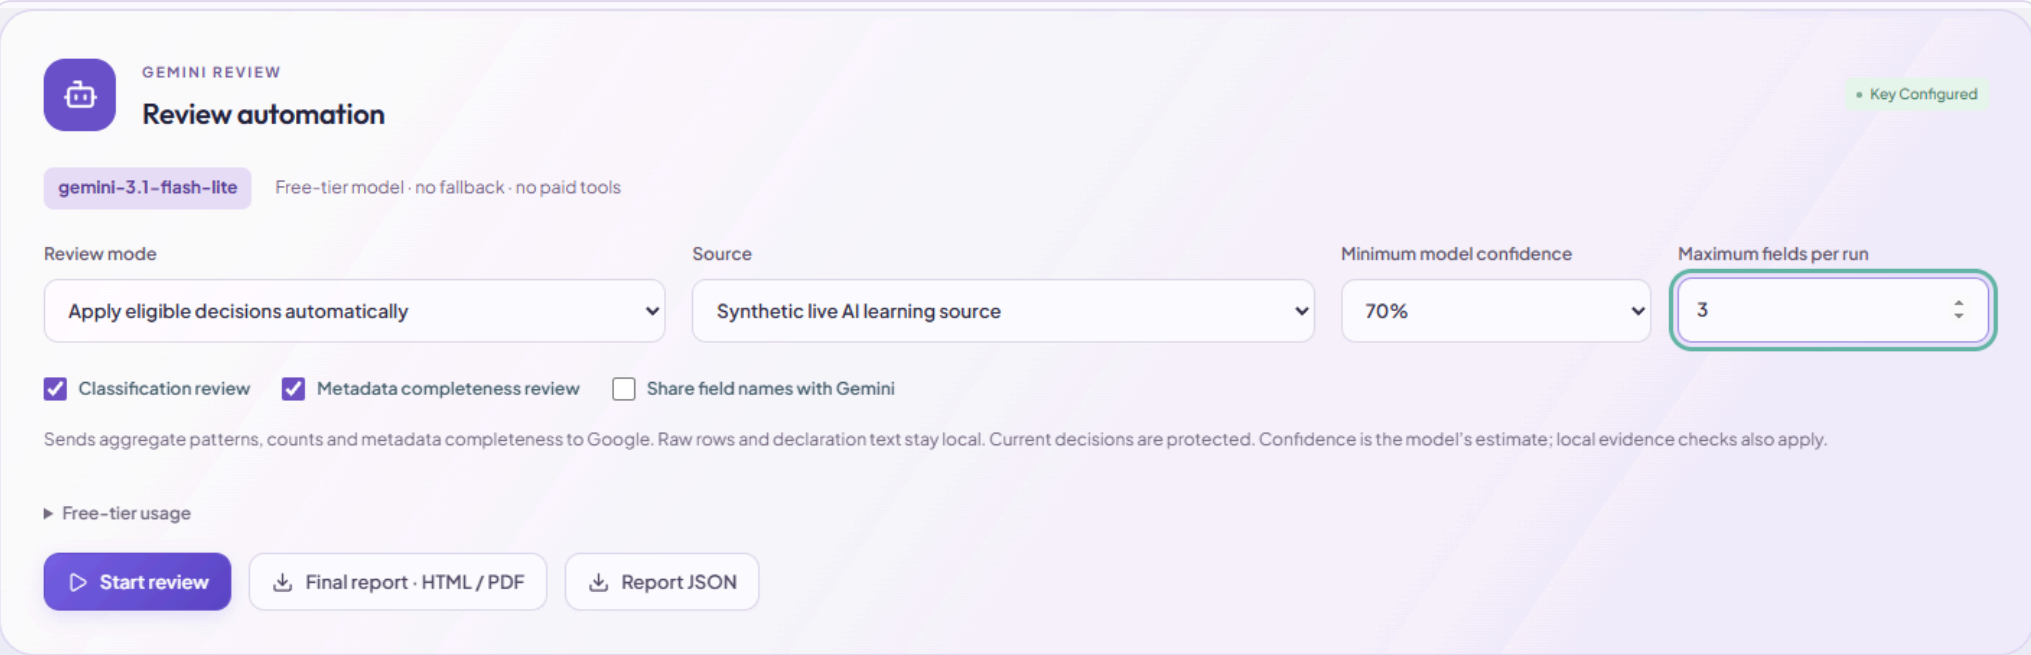

Actual browser capture. Click to enlarge in the HTML guide.

Observed: 3 scanned fields; 15 missing metadata items; no saved reviews.

ACTUAL GEMINI RUN · SCREENSHOT 03

Configure this review at 70%

For this requested review, automatic mode allows locally validated clear proposals at or above 70% model confidence to apply. Both scopes are requested for three fields. Mixed evidence and missing metadata still require unresolved outcomes. Field-name sharing is off.

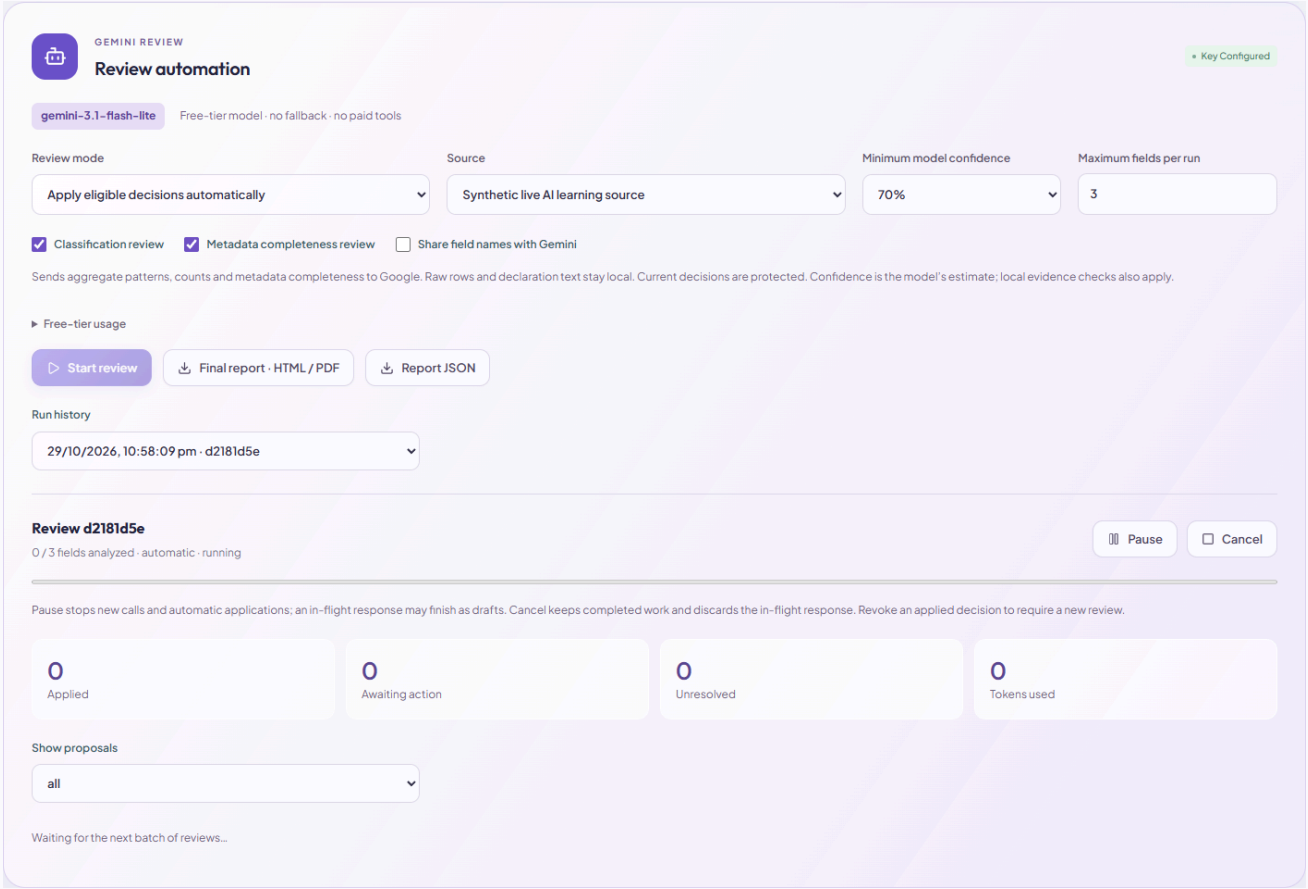

Actual browser capture. Click to enlarge in the HTML guide.

Observed: Actual Gemini API; maximum 3 fields; classification and metadata; confidence threshold 70% inclusive; field names off.

ACTUAL GEMINI RUN · SCREENSHOT 04

The server sends the aggregate evidence

The server freezes the selected evidence, snapshot references and review scopes. The real provider is called by the background worker. There is no simulated response or browser-route fixture in this capture.

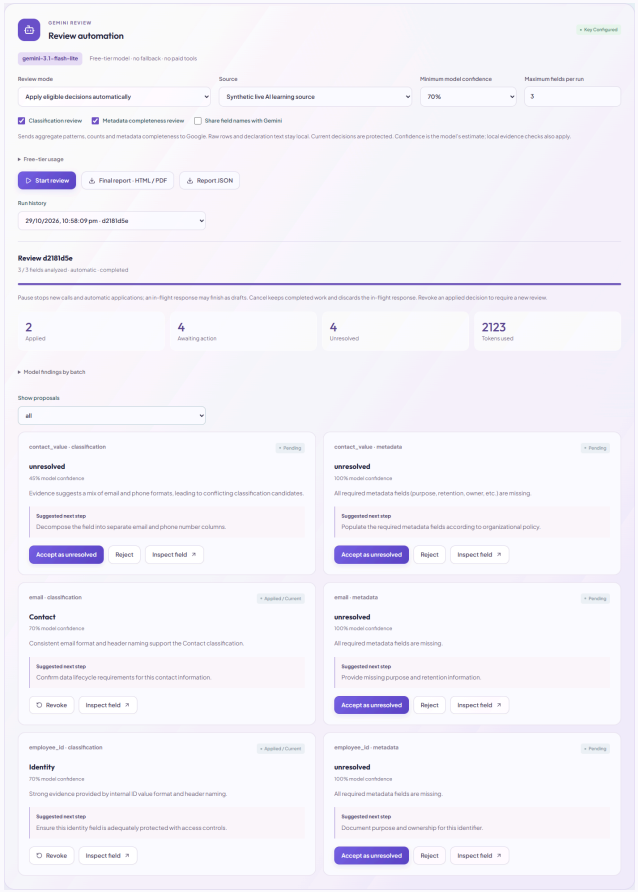

Actual browser capture. Click to enlarge in the HTML guide.

Observed: Run d2181d5e-34f3-4c1f-9b78-a5dc55319742; 3 fields requested. The screenshot records the state at capture time.

ACTUAL GEMINI RUN · SCREENSHOT 05

Inspect the actual completed run

The provider returned structured proposals. The backend checked the requested field/scope pairs, evidence references, ambiguity, metadata completeness and current revisions. Only eligible clear proposals were allowed to apply.

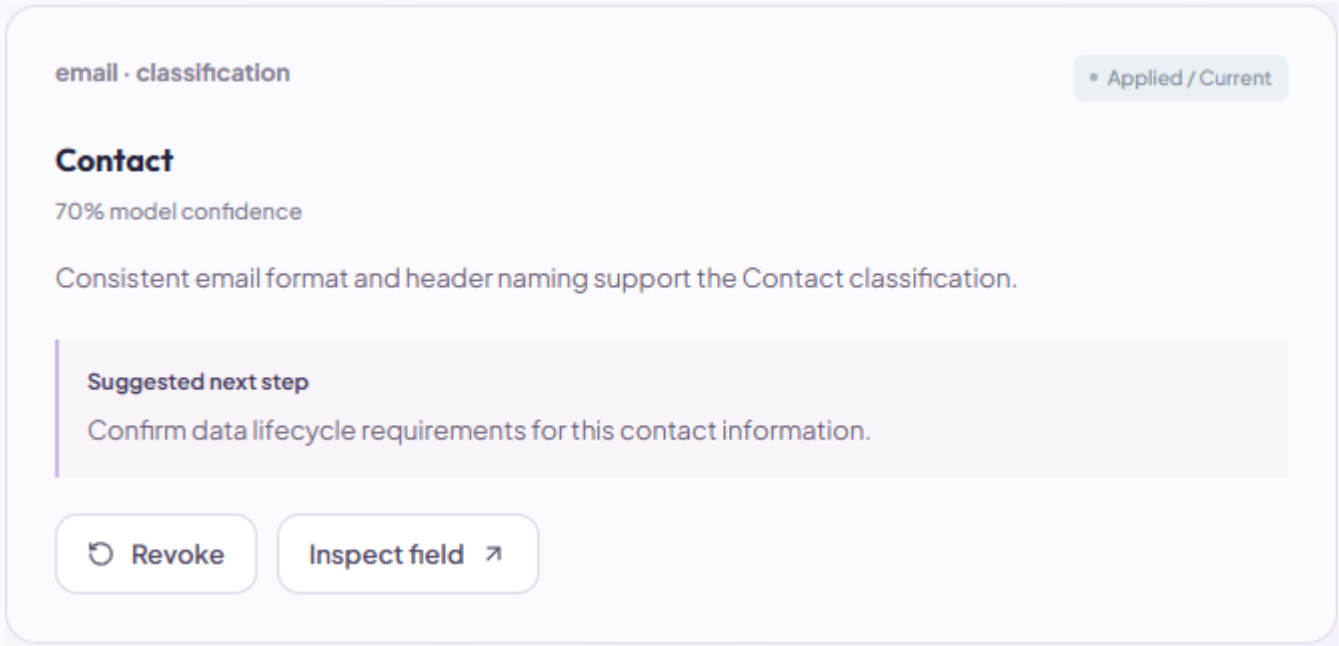

Actual browser capture. Click to enlarge in the HTML guide.

Observed: Actual result: 6 proposals; 2 applied; 4 pending; 4 unresolved; 2123 provider-reported tokens.

ACTUAL GEMINI RUN · SCREENSHOT 06

Read the email classification proposal

Read the model's actual rationale, cited class and confidence. Applied means a review was saved; pending means it still awaits action. The confidence is the model's self-assessment, not measured accuracy.

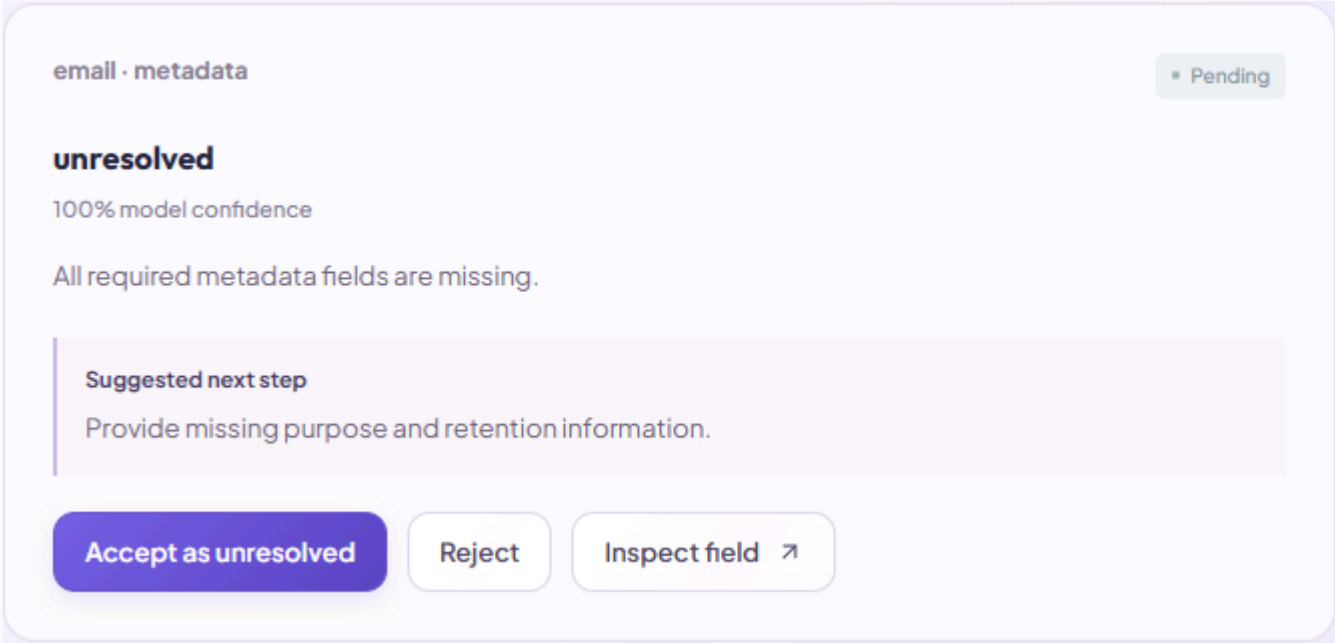

Actual browser capture. Click to enlarge in the HTML guide.

Observed: email classification: clear; applied; confidence 0.7.

ACTUAL GEMINI RUN · SCREENSHOT 07

Missing documentation stays unresolved

The source has no declared purpose, retention, owner or provenance. AI can identify that gap and suggest a next step, but it cannot invent the business declaration. A high confidence in an unresolved outcome is not permission to mark it complete.

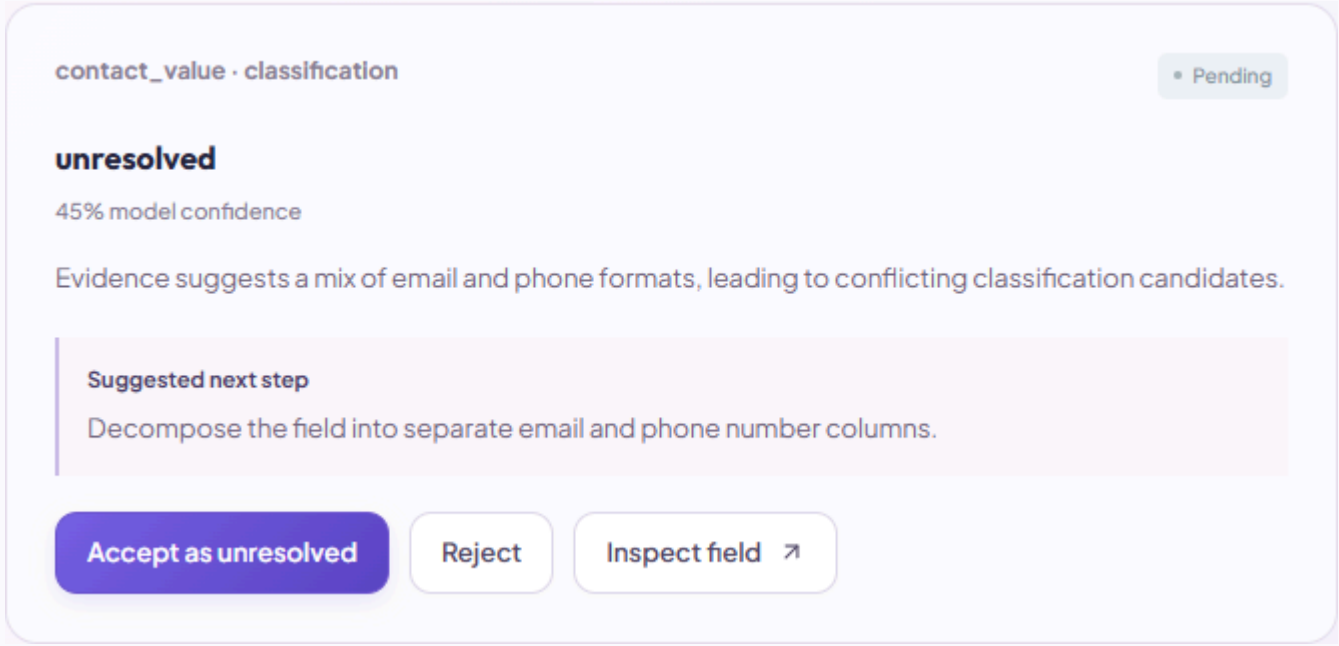

Actual browser capture. Click to enlarge in the HTML guide.

Observed: email metadata: unresolved; pending. Five metadata gaps remain for this field.

ACTUAL GEMINI RUN · SCREENSHOT 08

Mixed evidence needs clarification

contact_value has ten email-shaped and ten mobile-shaped values. The system preserves the mixed-field state. It does not allow an ambiguous/mixed field to become an automatically clear classification merely because the model sounds confident.

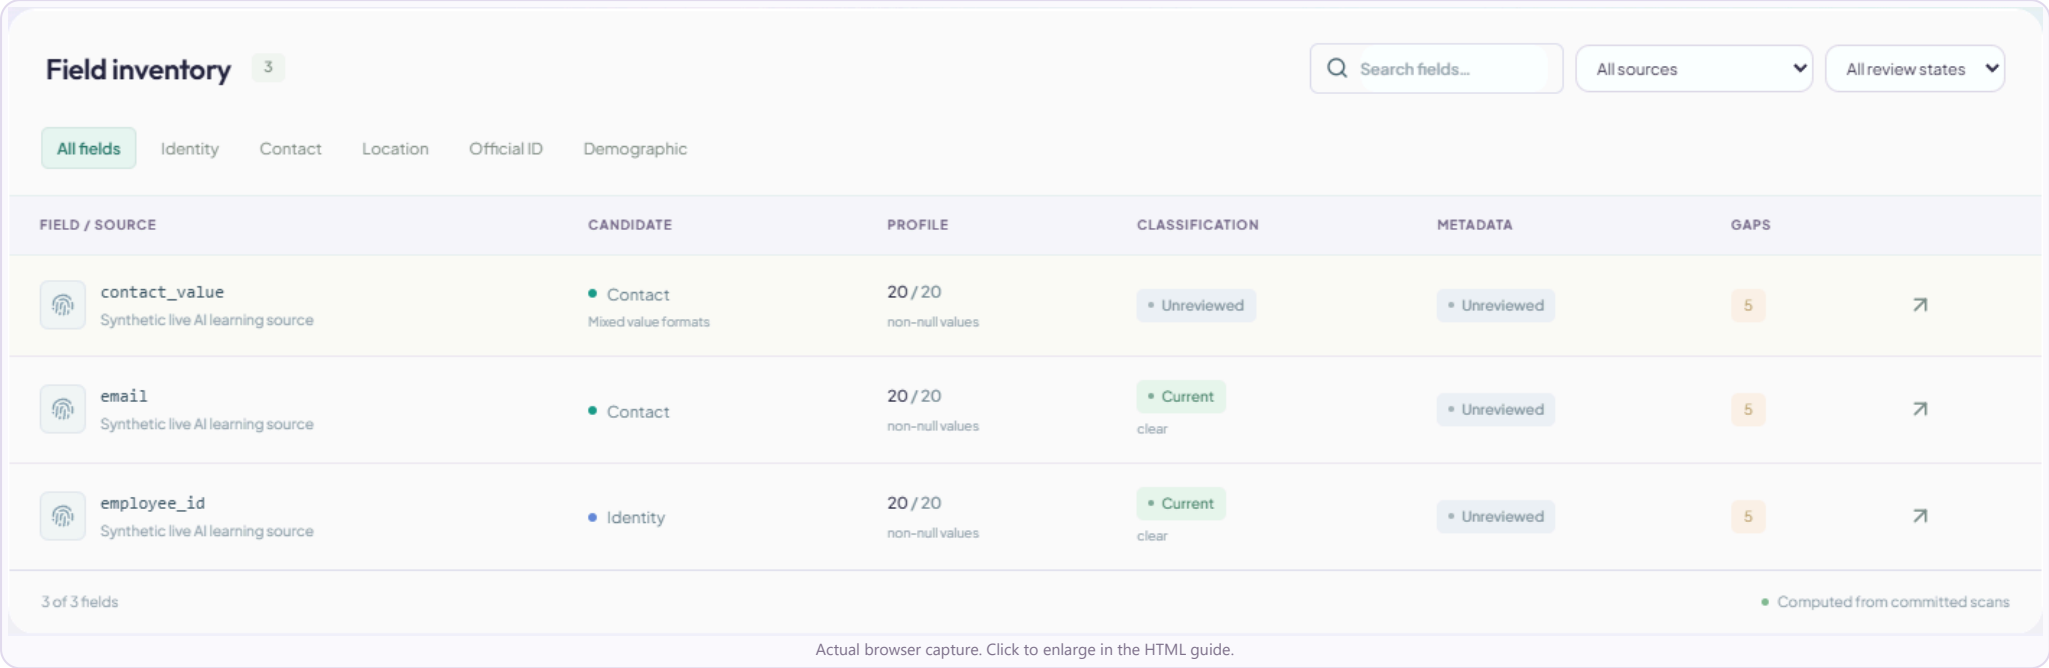

Actual browser capture. Click to enlarge in the HTML guide.

Observed: contact_value classification: unresolved; pending.

ACTUAL GEMINI RUN · SCREENSHOT 09

Applied AI decisions appear in the inventory

Current means the saved decision's dependencies are still fresh. Rows without applied decisions remain unreviewed. Metadata gaps stay visible regardless of whether classification was reviewed.

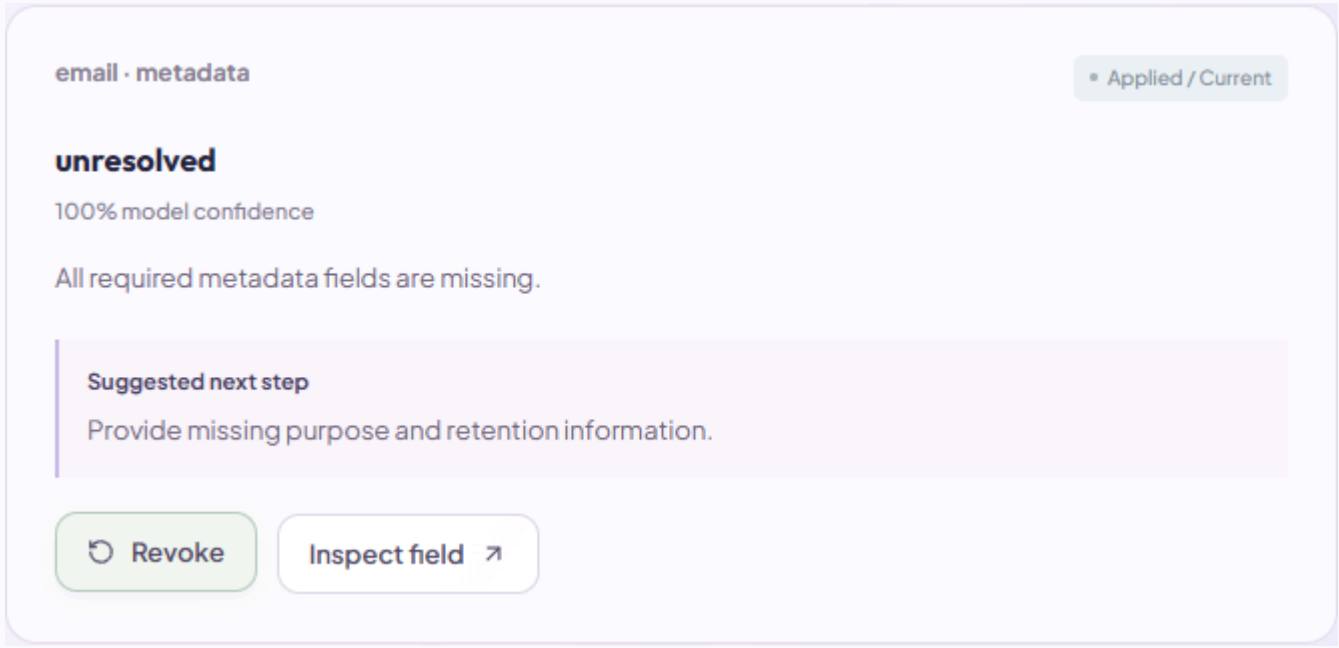

Actual browser capture. Click to enlarge in the HTML guide.

Observed: After the real run: 2 applied proposals; all 15 metadata gaps remain.

ACTUAL GEMINI RUN · SCREENSHOT 10

Accepting unresolved records the gap, not completeness

Accept as unresolved saves the AI-assisted metadata assessment. It is a current unresolved review, explicitly attributed to user-approved AI. It does not fill purpose or retention and does not make the field ready.

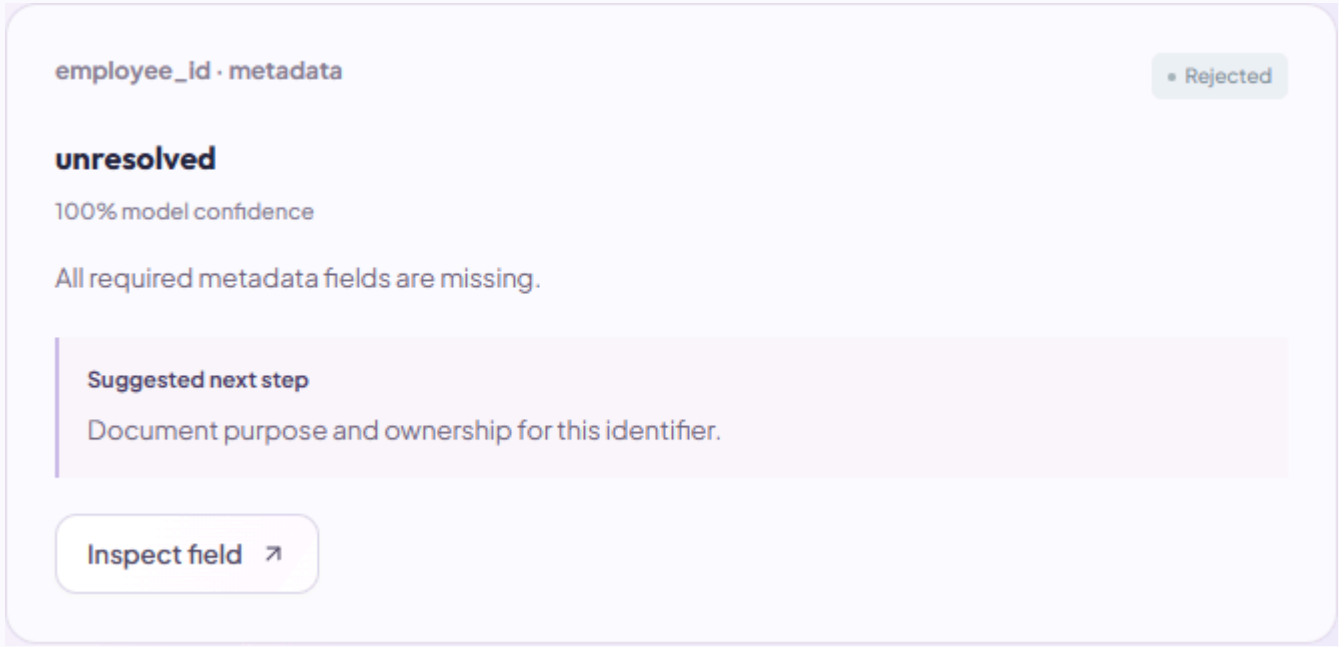

Actual browser capture. Click to enlarge in the HTML guide.

Observed: email metadata: applied / current, outcome unresolved. The five documentation gaps remain.

ACTUAL GEMINI RUN · SCREENSHOT 11

Reject a proposal without saving a review

Reject records the user's action on the proposal. It does not create a metadata review or remove documentary gaps. Existing current decisions are protected from AI overwrites.

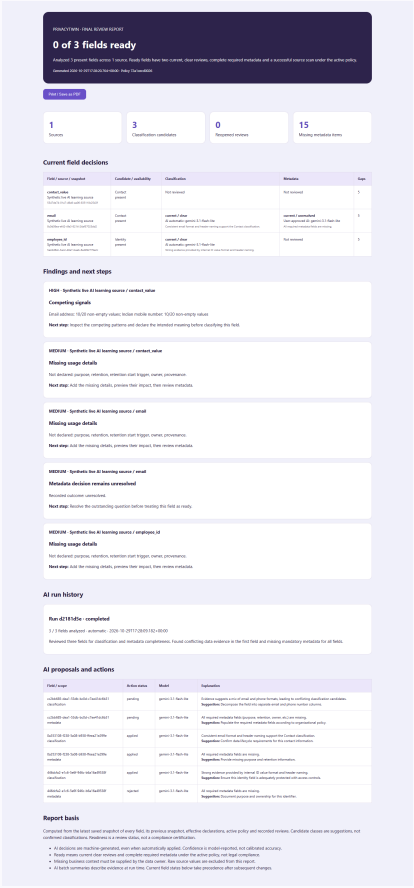

Actual browser capture. Click to enlarge in the HTML guide.

Observed: employee_id metadata proposal: rejected; no metadata review was created for it.

ACTUAL GEMINI RUN · SCREENSHOT 12

The report includes AI provenance and unresolved work

The actual report retains reviewer attribution, run information and proposal actions. Metadata gaps and unresolved outcomes remain visible. A report export does not approve a field.

PRIVACYTWIN · FINAL REVIEW REPORT

0 of 3 fields ready

Analyzed 3 present fields across 1 source. Ready fields have two current, clear reviews, complete required metadata and a successful source scan under the active policy.

Generated 2026-10-15T13:26:26.764+00:00 · Policy 72a1ee66b5b6

Sources	Classification candidates	Reopened reviews	Missing metadata items

Current field decisions

Field / source / snapshot	Candidate / availability	Classification	Metadata	Gaps
contact_value Synthetic live AI learning source 0a3ae3c1-91e7-4bb6-ad48-85f1142252f7	Contact present	Not reviewed	Not reviewed	5
email Synthetic live AI learning source 5a2f09ee-e0f2-4dd2-9115-2a6f7f22ea2	Contact present	**current / clear** AI automatic: gemini-3.1-flash-lite Consistent email format and header naming support the Contact classification.	**current / unresolved** AI automatic: gemini-3.1-flash-lite All required metadata fields are missing.	3
employee_id Synthetic live AI learning source 4ae0f8ec-4ce4-49ab-8a9d-f7ea1…	Identity present	**current / clear** AI automatic: gemini-3.1-flash-lite Strong evidence provided by internal ID value format and header naming.	Not reviewed	5

Findings and next steps

HIGH · Synthetic live AI learning source / contact_value

Competing signals

Email address: 19,00 non-empty values Incise mobile number: 1000 non-empty values

Next step: Inspect the competing patterns and declare the intended meaning before classifying this field.

MEDIUM · Synthetic live AI learning source / contact_value

Missing usage details

Not declared: purpose, retention, retention start trigger, owner, provenance.

Next step: Add the missing details, preview their impact, then review metadata.

MEDIUM · Synthetic live AI learning source / email

Missing usage details

Not declared: purpose, retention, retention start trigger, owner, provenance.

Next step: Add the missing details, preview their impact, then review metadata.

MEDIUM · Synthetic live AI learning source / email

Metadata decision remains unresolved

Reopened outcome: unresolved.

Next step: Resolve the outstanding question before treating this field as ready.

MEDIUM · Synthetic live AI learning source / employee_id

Missing usage details

Not declared: purpose, retention, retention start trigger, owner, provenance.

Next step: Add the missing details, preview their impact, then review metadata.

AI run history

Run d2181d5e · completed

3 / 3 fields analyzed · automatic · 2026-10-29T17:28:09.582+00:00

Reviewed three fields for classification and metadata completeness. Found conflicting data evidence in the first field and missing mandatory metadata for all fields.

AI proposals and actions

Field / assign	Action status	Model	Explanation
ce3ab482-dba1-5b8b-bd3d-c7aa03dc8b21 classification	pending	gemini-3.1-flash-lite	Evidence suggests a mix of email and phone formats, leading to conflicting classification candidates. **Suggestion:** Decompose the field into separate email and phone number columns.
ce3ab482-dba1-5b8b-bd3d-c7aa03dc8b21 metadata	pending	gemini-3.1-flash-lite	All required metadata fields (purpose, retention, owner, etc.) are missing. **Suggestion:** Populate the required metadata fields according to organizational policy.
0a2f0738-f230-5a26-b850-9ead7e2f9fe classification	applied	gemini-3.1-flash-lite	Consistent email format and header naming support the Contact classification. **Suggestion:** Confirm data lifecycle requirements for this contact information.
0a2f0738-f230-5a26-b850-9ead7e2f9fe metadata	applied	gemini-3.1-flash-lite	All required metadata fields are missing. **Suggestion:** Provide missing purpose and retention information.
d4de4a2-e1c6-5ef9-9d6c-b6a78a8f3328 classification	applied	gemini-3.1-flash-lite	Strong evidence provided by internal ID value format and header naming. **Suggestion:** Ensure this identity field is adequately protected with access controls.
d4de4a2-e1c6-5ef9-9d6c-b6a78a8f3328 metadata	rule-test	gemini-3.1-flash-lite	All required metadata fields are missing. **Suggestion:** Document purpose and ownership for this identifier.

Report basis

Compiled from the latest saved snapshot of every field, its previous snapshot, effective declarations, active policy and recorded reviews. Candidate classes are suggestions, not confirmed classifications. Readiness is a review status, not a compliance certification.

- AI decisions are machine-generated, even when automatically applied. Confidence is model-reported, not calibrated accuracy.
- Ready means current clear reviews and complete required metadata under the active policy, not legal compliance.
- Missing business context must be supplied by the data owner. Raw source values are excluded from this report.
- AI batch summaries describe evidence at run time. Current field states below take precedence after subsequent changes.

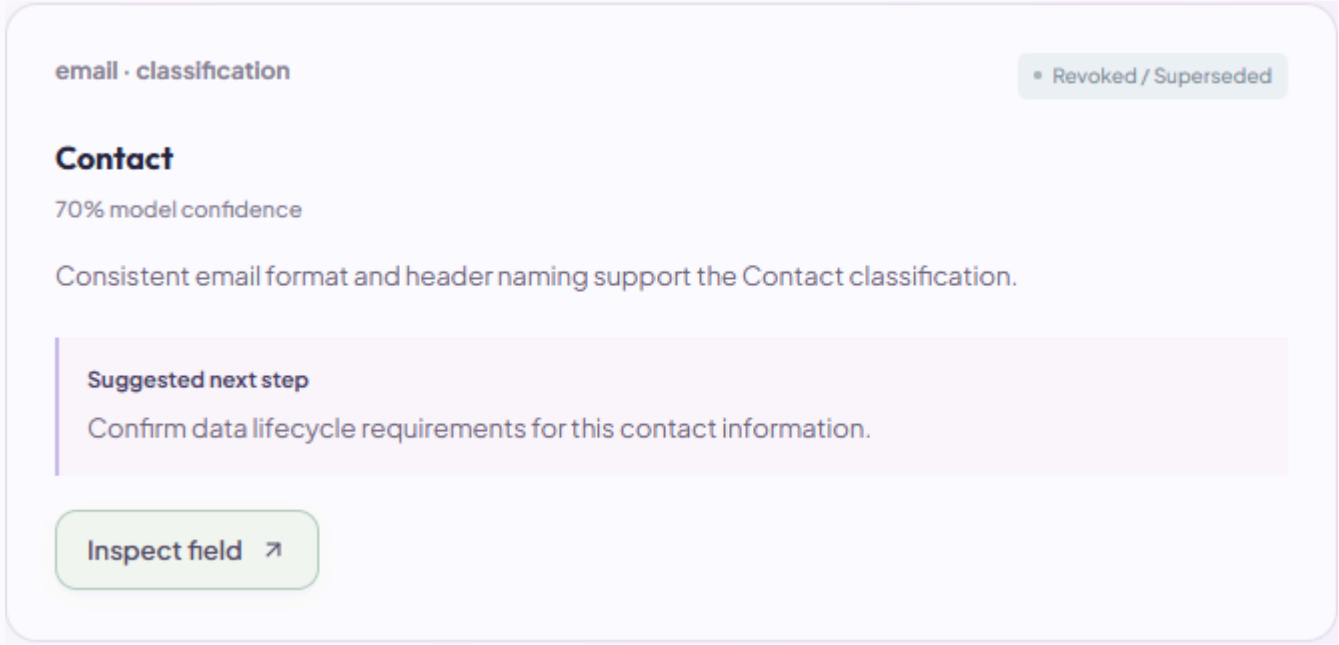

Actual browser capture. Click to enlarge in the HTML guide.

Observed: Live run d2181d5e-34f3-4c1f-9b78-a5dc55319742 is included in report history. All three fields still have documentation gaps.

ACTUAL GEMINI RUN · SCREENSHOT 13

Revoke an applied AI decision

Revoke supersedes that applied AI review. It requires a fresh review and does not silently restore an earlier approval. The original proposal and action remain in the audit history.

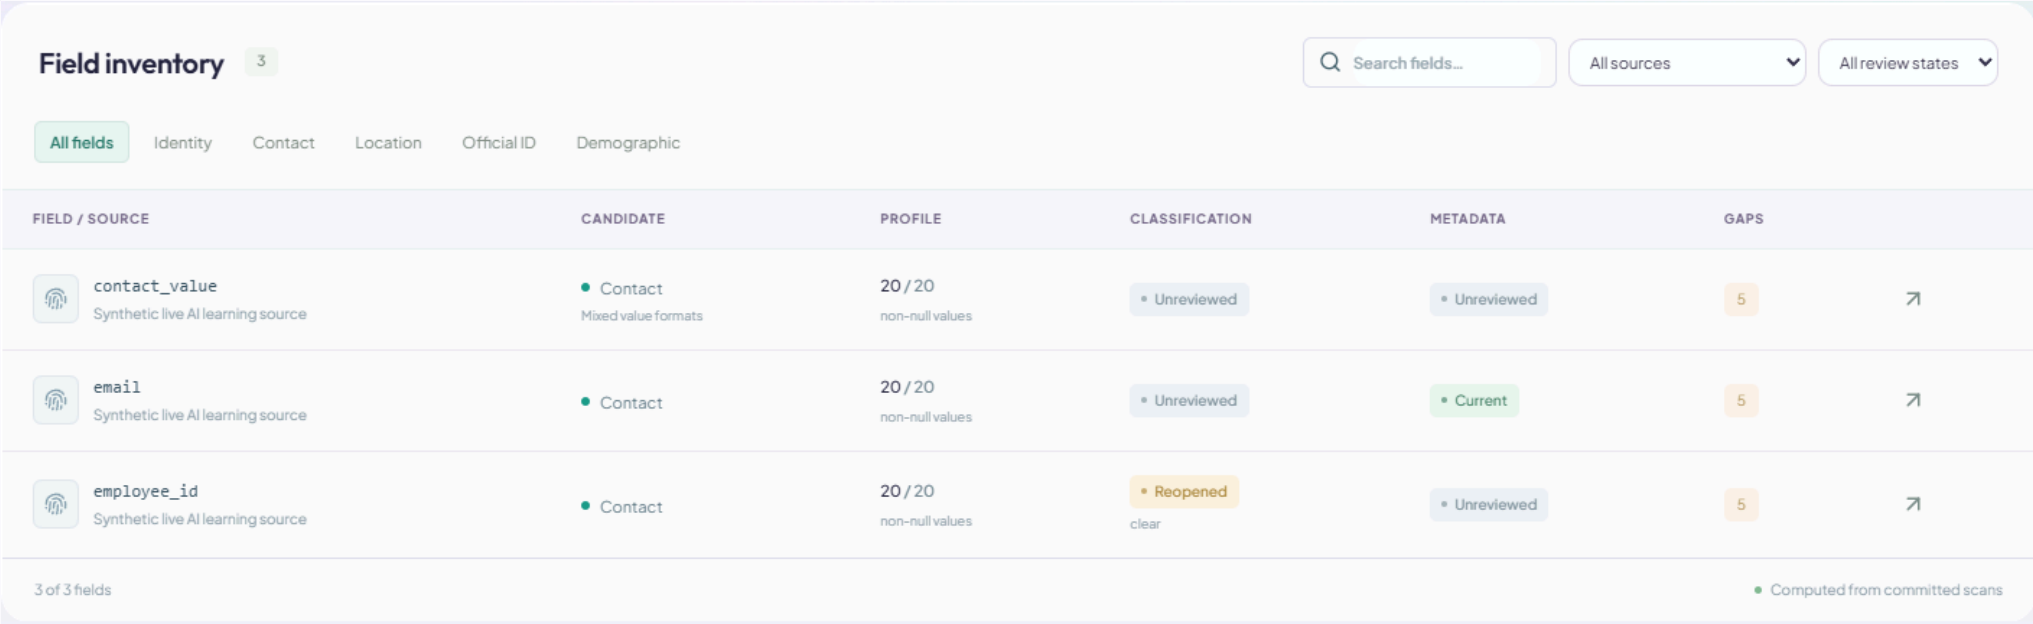

Actual browser capture. Click to enlarge in the HTML guide.

Observed: email classification: revoked / superseded. No current classification decision remains for that field.

ACTUAL GEMINI RUN · SCREENSHOT 14

ReviewGuard also checks AI-origin decisions

Only employee_id values changed to phone-shaped numbers. Its saved AI-origin classification review now reopens through the ordinary dependency logic. Accepting AI output does not bypass later evidence checks. No second AI call was made.

Actual browser capture. Click to enlarge in the HTML guide.

Observed: employee_id now has a Contact candidate and a reopened classification review. email's revoked classification remains unreviewed.

Verified for this review

- real provider completed: **True**
- expected six proposals: **True**
- missing metadata unresolved: **True**
- mixed classification unresolved: **True**
- accepted unresolved did not fill metadata: **True**
- rejection verified: **True**
- revocation verified: **True**
- ai origin review reopened on changed values: **True**
- raw values absent from saved model input: **True**
- field names not shared: **True**
- browser errors: **0**

Provider result, input evidence and report exports are included alongside the screenshots. Automated threshold tests additionally verify that exactly 70% applies, 69.9% stays pending, and incomplete metadata stays unresolved.

> The run uses synthetic data and a disposable workspace. A real provider call consumes quota; this report does not infer a monetary cost or billing tier from token counts. No credentials are included in the artifacts.
